

BLU-RAY/HD DVD PLAYER

New High-Definition DVD Formats Deliver 1080p Video But Only with the Right Connection.

New Blue-ray Disc™ and HD DVD™ players have multiple video connections, but only one can deliver stunning 1080p video. To watch your new HD DVD and Blu-ray discs in the highest possible resolution, you need to use an HDMI™ connection.

HDMI Version 1.3 is also the ultimate connection for surround sound. It supports the newest high-resolution surround sound formats, including Dolby® True HD and DTS-HD Master Audio™.

• HDMI is the best digital audio/video connection available today, supporting ultimate 1080p video with stunning 12-bit color and lossless 5.1/7.1 surround sound. If your AV receiver doesn't feature HDMI, use its component video connections.

- Component video supports 720p/1080i high definition video and 480p enhanced definition video, also referred to as progressive scan.
- For 5.1/7.1 surround sound without HDMI, use your components' fiber optic or digital coax connections.
